Python Developer

About me

I am a Python developer with experience in creating software, including console applications, Telegram bots, and REST APIs. Below are the main areas of my expertise:

Python Development : Creating user interaction logic, data processing, and implementing complex algorithms (e.g., IMEI validation using the Luhn algorithm).

Database Management : Experience working with PostgreSQL, MySQL, SQLite, as well as using SQLAlchemy and Alembic for managing migrations.

API Development : Building RESTful services using FastAPI and Flask, including token-based authorization and handling JSON requests.

Telegram Bots : Implementing bots with functionality for data verification, authorization, and integration with external services.

Containerization : Experience with Docker for creating isolated development and deployment environments.

Version Control : Working with Git and GitHub for project management, including creating repositories, commits, and uploading code.

Localization and Translations : Developing multilingual applications using translation systems (e.g., support for Russian and English languages).

Testing : Writing unit and integration tests to ensure the correct functioning of programs.

In addition to technical skills, I possess analytical thinking, attention to detail, and the ability to solve complex problems. I work well in a team, quickly learn new technologies, and effectively communicate with colleagues and clients.

Desired industry

- IT, Tech

- JSON Web Token
